Project Plan 2: Spending Balance Tracker

This app will incorporate the base of a list/to do app, but with a calculation component. The idea is that a user will be able to open the app, and find a screen that has the option to add the total amount of money that the user is working with. Then each added item the list either adds or subtracts from the initial amount. This will be useful for a user to keep track of a budget or balance a checking/savings account without the need of having to log in to a bank app or without having to import personal information.

Initial screen with the option to add the initial amount to be saved and stored

- Create a table that can hold items
- Create an item class
- Add buttons that will make the item either an addition or deduction (after the initial)
- Each item will have a name-description-date-and amount

Some features that would be great to have would be creating multiple budgets- this would be great for event planning or multiple accounts. A hide feature the only shows “recent” items.

- An alert for when some info is missing from an added item
